Current probes are key to the successful design of electrical devices, medical instruments, and electronic parts. In combination with an oscilloscope or HIOKI MEMORY HiCORDER, probes are ideal for measuring currents with high accuracy and wide bandwidths, making them indispensable tools for evaluating current consumption and control current. In recent years, customers are seeking current probes with high sensitivity to increase the accuracy of design and verification. To further enhance our rich lineup of current probes, HIOKI now delivers two new, highly-sensitive current probes that can measure low level currents from 1 mA.

Analyze currents in finer detail

10x Sensitivity  Clearly observe even 1 mA waveforms

The output rate for the CT6700/CT6701 is 1 V/A. When 1 mA is measured, it can output 1 mV. This is ten times the sensitivity of our legacy*1 models. Now, even 1 mA waveforms can be clearly captured.*2

*1: CURRENT PROBE 3273-50/3276
Output rate 0.1 V/A, 30 A MAX

*2: When measuring low level currents, in addition to noise from the current probe itself, there is also influence from external noise or noise from the connected meter.

Improved S/N Ratio: Measure even the extremely low current signals buried in noise

Low level currents can only be clearly captured by instruments that deliver a good S/N ratio. Because the output rate is now 1 V/A (10x than that of legacy models), you can observe waveforms even if the oscilloscope’s range is 1/10 than that of legacy products. By allowing for range selection with leeway for the S/N ratio, you can clearly observe signals that previously were buried in noise.

Input:
1 mAp-p, 1 kHz, sine wave
Oscilloscope: Bandwidth 2 GHz (No bandwidth limitation), 10 mV/div

Input: 20 mAp-p, 1 kHz, sine wave
Oscilloscope: Bandwidth 2 GHz (No bandwidth limitation), 10 mV/div

Input: 20 mAp-p, 1 kHz, square wave
Oscilloscope: Bandwidth 2 GHz (No bandwidth limitation), 10 mV/div
The sensor has been redesigned, making it more compact and easier to handle, in a form that fits perfectly in your hand. The ergonomic structure is ideal for situations with complex electrical circuit design and wiring.

**Slim Sensor**

With the CT6700/CT6701, you can automatically perform the zero-adjustment, which must be done before use, by pressing a single button. By pressing and holding the button for demagnetization, you can cancel an offset margin of error after measuring a large current.

**Automatic Zero-Adjustment and Demagnetization in One Button**

The warning lamp will flash if a current exceeding the rating is input. “JAW UNLOCKED” will display and the warning lamp will light up if the sensor is unlocked when clamped.

**Warning Features**

The BNC connector does not need to be rotated when connecting to an oscilloscope or recorder. Insert the connector until it automatically locks into place. To disconnect it, just pull the unlock lever toward you.

**One-touch Disconnection from the BNC Terminal**

**Built for Demanding Applications**

- Measure the current of automobile electronic parts
  - Observe control currents, which flow through automobile electronic parts such as compact motors, on the mA order.

- Evaluate the current characteristics of circuit components
  - When testing for the correct functioning of built-in circuits, you can reliably catch noise waveforms with a wide frequency bandwidth.

- Evaluate high-speed switching elements
  - Measure switching elements that drive devices such as LEDs and motors, including the ON/OFF response of semiconductors that operate at high speeds, ripple waveforms, and switching loss.

- Streamlining Measurement
  - Measure switching elements that drive devices such as LEDs and motors, including the ON/OFF response of semiconductors that operate at high speeds, ripple waveforms, and switching loss.
